CAREN NJERI WAMBUI
Aspiring Data Scientist

Thika | carenjeri45@gmail.com | +254720493529 | Github | LinkedIn

EDUCATION

Moi University
Eldoret, Uasin Gishu
Bachelor of Science / Major in Applied Statistics with Computing
2022- Present

PROFESSIONAL SUMMARY

Detail-oriented lifelong learner with strong foundations in data analytics, AI-driven solutions, project coordination, and administrative support. Excel at converting complex datasets into actionable insights that optimize operations and enable data-informed decisions. Passionate about transitioning into data science, bringing analytical rigor, technical adaptability, and proven project management skills to drive efficiency in fast-paced environments.

SKILLS

Technical: Python, R, SQL, Data Visualization and Analysis, Power BI
Tools: Google Workspace, Spreadsheets, Microsoft office (Excel, PowerPoint)
Soft skills: Communication, Time management, Creative and analytical skills

PROJECT EXPERIENCE

Nairobi House Price Prediction Model
Group Research Project | Python.
Nov 2025 – Present

- Developed end-to-end XGBoost regression model using Python, Pandas, Scikit-learn on ~500 Nairobi property listings, incorporating features such as location, bedrooms, bathrooms, and size; achieved R^2 of ~0.85 and RMSE of ~25M KES on test data after hyper parameter tuning via GridSearchCV, enabling accurate price forecasting for real estate stakeholders.
- Performed in-depth EDA and feature engineering; identified 30–50%+ price premiums in premium areas (Kilimani, Westlands, Runda), informing investment and valuation strategies.
- Benchmarked Linear Regression, Random Forest, and tuned XGBoost; delivered performance comparison and recommendations for spotting undervalued properties, translating analytics into business value.

AI impact on employment trends analysis

Personal Project | Python, R
Oct 2025 – Jan 2026

- Conducted NLP analysis of World Bank, OECD reports, and 2015–2025 news/job trends using Python; found net positive job creation (~20–30% higher in AI/tech sectors) despite automation risks in routine administrative and manufacturing roles.
- Built time-series forecasting models (Prophet/ARIMA) and classification frameworks to predict automation exposure levels ; estimated 20–40% displacement risk in routine tasks, with growth/augmentation in cognitive, creative, and data-related fields.
- Created visualizations, reports, and insights highlighting skill polarization and upskilling needs, offering evidence-based recommendations for workforce strategy, policy, and professional development.
